

**Direct measurement of
COVID-19 VIRUS IN THE AIR**

is not possible, but we *can* measure how well fresh air is flushing out any virus that may be present.

Safetulator™ Fresh Air Meter Measurement:

600	800	1000	1200	CO2 PPM
Fresh air at CDC & World Health Organization recommendations		Adequate fresh air only via added air purifiers	Unhealthy with or without a pandemic	High risk - take immediate actions to improve

Good fresh air ventilation is like a mask for the whole building. Just like a mask, it does not give you 100% protection, but it does reduce the risk. It's easy to accomplish, and way more fun than wearing a mask!

How to accomplish:

- Use a Safetulator™ Fresh Air Meter which will show “green” at a CO2 level of 800 ppm or less.
- Open windows, install window fans, or operate your ventilation system to “keep it in the green”.
